### Problem Statement

### Proposed System

### Modules

### Evaluation Measure

### Progress So Far

### Gantt Chart

### Conclusion

# Software Defined Networking

- Emerging network architecture.
- Separates control plane from data plane.
- Control plane provides a global view and is programmable.

# Software Defined Networking Architecture

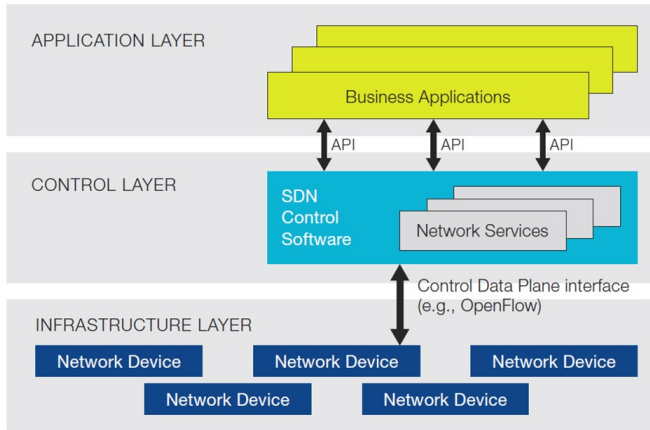

Fig. 1: SDN architecture\*

\* adapted from Jammal et al.

# Software Defined Networking

- For large scale network, single controller is not enough.
- Multiple controllers were introduced.
- Leads to some research challenges
  - Maintaining global view of the network
  - Optimal placement of controllers

Gantt Chart

Conclusion

# Controller Placement Problem

Given a network topology

- How many controllers are needed?
- Where in the topology should they go?

Problem Statement

Proposed System

Modules

Evaluation Measure

Progress So Far

Gantt Chart

Conclusion

# Current Methods and Their Issues

- K- center based approaches
- Clustering based approaches
- Issue
  - All methods need to specify the number of controllers as input.

Conclusion

# Problem Statement

## Problem Statement

To determine the number of controllers and their location in software defined networking using affinity propagation

# CONTENTS

Gantt Chart

Conclusion

# Overview of Proposed System

- Create network topology.
- Partition the network into sub networks using affinity propagation algorithm  
Affinity propagation clustering automatically determines the number of sub networks
- Balance the number of nodes in subnetwork
- Placement of controller in each sub network

Gantt Chart

Conclusion

# Modules

# Creation of network topology

- Select a network like cernet, internet2 OS3E  
(Here we use internet2 OS3E network)
- Collect longitude, latitude and location(city) of nodes in that network
- Create network topology

# Clustering and Load balancing

- Partition the network into sub networks using affinity propagation.
- There are exemplars in the sub network which represents it.
- Check the number of nodes in sub networks.
- If it is greater than a predefined threshold value allocate it to neighbouring sub networks.
- Place controllers in the location of exemplars.

# Why Affinity Propagation??

- Automatically determines the number of controllers
- Exemplar based message passing algorithm
- Input: Shortest distance between nodes  
(measure of latency)

Current Methods and Their Issues

Problem Statement

Proposed System

Modules

**Evaluation Measure**

Progress So Far

Gantt Chart

Conclusion

# Evaluation Measure

- Average case latency
- Worst case latency
- Imbalance metric

# CONTENTS

Current Methods and Their Issues

Problem Statement

Proposed System

Modules

Evaluation Measure

Progress So Far

Gantt Chart

Conclusion

# Progress So Far

- Completed literature survey.
- Completed module designing.
- Studied papers in network which uses clustering methods.
- Chose evaluation metrics
- Included load balancing module.
- Created network topology.
  - Chose Internet2 OS3E network as input
  - Collected details about Internet2 OS3E(longitude and latitude of nodes, city in which node is located)
  - Wrote code to select topology

Gantt Chart

Conclusion

# Conclusion

- Proposed system for controller placement problem is discussed.
- Different modules of the system are discussed.
- Progress of the work done is discussed.
